An apoprotein known as Cph2 from Synechocystis species is used as the apophytochrome and the bilin is preferably phycoerythrobilin. The phytofluors are useful as fluorescent markers for biological research. The phytofluors have a long wavelength absorption maxima, a high molar absorption coefficient and the recombinant apoproteins can spontaneously assemble with a variety of bilin chromophore precursors. The present sequence is a phytochrome related protein from Synechocystis sp.
                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1020
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    960
```

The present invention is related to fluorescent apophytochrome-bilin conjugates, known as phytofluors. An apoprotein known as Cph2 from Synechocystis species is used as the apophytochrome and the bilin is preferably phycocrythrobilin. The phytofluors are useful as fluorescent markers for biological research. The phytofluors have a long wavelength absorption maxima, a high molar absorption coefficient and the

The protein is a diguanylate phosphodiesterase A, i.e. it enzymatically cleaves a single phosphodiester bond in c-di-GMP to yield the linear dimer pGpG. See also AAR38154.

                                                                                                                                                                                                                        amino acid sequence of protein PDEA3 was deduced from the 1st. reading frame of the cdg3 operon. The protein is a digranylate sphodiesterase A, i.e. it enzymatically cleaves a single sphodiester bond in c-di-GMP to yield the linear dimer pGpG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1993-197062/24.

The protein is a diguanylate phosphodiesterase A, i.e. it enzymatically cleaves a single phosphodiester bond in c-di-GMP to yield the linear dimer pGpG. See also AAR38149 and AAR38151-R38152.

                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAH84373 to AAH84499 represent Escherichia coli growth and proliferation related DNA sequences (I). AAH84500 to AAH84670 encode the E. coli growth and proliferation related proteins given in AAG98978 and AAG98830 to AAG98999. (I) can be used as potential targets for the generation of new antimicrobial agents, and for identification of compounds which interact with the gene products of (I). In addition the expression of (I) and the purification of the proteins, the purified proteins can be used to generate reagents and screen small molecule libraries or other candidate compound libraries for compounds that can be further developed to yield novel antimicrobial compounds. In addition, nucleic acid probes
                                                                                                                                                                                                                                                                                               complementary to (I) that are specific for particular species of microorganisms can be used to identify particular microorganism species in clinical specimens, therefore, providing a rapid and dependable method by which to identify the causative agents of a bacterial infection. Also, antibodies generated against proteins translated from mRNA transcribed from proliferation required sequences can also be used to screen for specific microorganisms that produce such proteins in a species-specific manner. AAH84371 and AAH84670 represent sequencing primers used in the isolation of E. coli growth and proliferation related sequence, which are used in an example from the present

                                                                                  The amino acid sequence of protein DGC2 was deduced from the 2nd. open reading frame of the cdg2 operon. The protein has diguanylate cyclase activity, i.e. it enzymatically converts two molecules of GTP to bis-(3.5')-cyclic diguanylic acid.

The protein has diguanylate cyclase activity, i.e. it enzymatically converts two molecules of GTP to bis-(3'5')-cyclic diguanylic acid.

An apoprotein known as Cph2 from Synechocystis species is used as the apophytochrome and the bilin is preferably phycoerythrobilin. The phytofluors are useful as fluorescent markers for biological research. The phytofluors have a long wavelength absorption maxima, a high molar absorption coefficient and the recombinant apoproteins can spontaneously assemble with a variety of bilin chromophore precursors. The present sequence is a phytochrome related protein from Synechocystis sp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fluorescent apophytochrome-bilin conjugates, e.g. Cph2 (derived Synechocystis species) and phycoerythrobilin conjugate, useful a fluorescent markers for biological research -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention is related to fluorescent apophytochrome-bilin conjugates, known as phytofluors. An apoprotein known as Cph2 from Synechocystis species is used as the apophytochrome and the bilin is preferably phycoerythrobilin. The phytofluors are useful as fluorescent markers for biological research. The phytofluors have a long wavelength absorption maxima, a high molar absorption ceefficient and the recombinant apoproteins can spontaneously assemble with a variety of bilin chromophore precursors. The present sequence is a phytochrome related protein from Synechocystis sp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fluorescent apophytochrome-bilin conjugates, e.g. Cph2 (derived from Synechocystis species) and phycoerythrobilin conjugate, useful as fluorescent markers for biological research -

                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nakagawa

An apoprotein known as Cph2 from Synechocystis species is used as the apophytochrome and the bilin is preferably phycoerythrobilin. The phytofluors are useful as fluorescent markers for biological research. The phytofluors have a long wavelength absorption maxima, a high molar absorption coefficient and the recombinant apoproteins can spontaneously assemble with a variety of bilin chromophore precursors. The present sequence is a phytochrome related protein from screens and construction from the present sequence is a phytochrome related protein from screens and the present sequence is a phytochrome related protein from screens and the present sequence is a phytochrome related protein from screens and the present sequence is a phytochrome related protein from screens and the present sequence is a phytochrome related protein from screens and the protein from screens and the present sequence is a phytochrome related protein from screens and the p
